

GRADED ASSIGNMENT

Course : TIPP – AAI
Module Name : Machine Learning Fundamentals
Submitted By: : Koay Seng Tian (sengtian@yahoo.com)
19 February 2020

1. Introduction

The Pima are a group of Native Americans living in Arizona. A genetic predisposition allowed this group to survive normally to a diet poor of carbohydrates for years. In recent years, due to a shift of dietary disposition to processed foods, it had made them develop the highest prevalence of type 2 diabetes and for this reason they have been the subject of many studies.

This dataset came originally from the 'National Institute of Diabetes and Digestive and Kidney Diseases'. The objective is to predict, based on diagnostic measurements whether a patient has diabetes. Patients were females at least 21 years old of Pima Indian heritage. This is a classification task for machine learning.

Data Source: <https://www.kaggle.com/kumargh/pimaindiandisabetescsv>

2. Machine Learning Process

The machine learning process are as shown.

2.1 Load the dataset.

2.2 Check the dataset for abnormality.

2.2.1 Are the values in reasonable range? The data are in reasonable range.

2.2.2 Any NULL values in the dataset? No null value was detected

2.2.3 Any missing values in the dataset? No missing value in the dataset.

2.2.4 Are the zero values in the dataset reasonable?

2.2.4.1 It is reasonable to have zero pregnancy, but it is unreasonable for age to be zero.

2.2.4.2 Zero values in the dataset were replaced by media values.

2.2.5 Check class imbalance.

2.2.5.1 The ratio of No Diabetes vs Diabetes patient outcomes is 65:35.

2.3 Normalize dataset.

2.3.1 Standard scaler (scikit-learn) was used to normalize the dataset.

2.4 Feature selection.

2.4.1 Correlation matrix generated. The first four features were selected to train the model.

Outcome	1.000000
Glucose	0.492782
BMI	0.312038
Age	0.238356
Pregnancies	0.221898
SkinThickness	0.214873
Insulin	0.203790
DiabetesPedigreeFunction	0.173844
BloodPressure	0.165723

2.5 Select, train and evaluate model.

2.5.1 Dataset is splitted by a ratio of 70:30. 70% is splitted to be the training dataset and the remaining (30%) is allocated for the test dataset.

2.5.2 Several models from Scikit-learn were tested to determine the top three models. Also, another model (XGBoost) was installed and preliminary testing was performed. XGBoost was one of the popular algorithms used in Kaggle competitions in 2017.

XGBoost: <https://xgboost.readthedocs.io/en/latest/>

2.5.3 Top three models based on ROC_AUC metrics were: Logistic Regression, GaussianNB and XGBClassifier tested on training dataset.

Classifier	ROC_AUC	STD
LogisticRegression	0.840028	0.050242
GaussianNB	0.838754	0.047571
XGBClassifier	0.820604	0.046226
SVC	0.812427	0.055112
RandomForestClassifier	0.810918	0.056176
KNeighborsClassifier	0.794917	0.046037
DummyClassifier	0.503286	0.062151

2.5.4 The model selected based on test dataset is XGBoost. The ROC_AUC metric was the highest amongst the three models. The result of the three models are as shown.

--- Metrics ---

XGBoost:

	precision	recall	f1-score	support
0	0.79	0.85	0.82	150
1	0.68	0.57	0.62	81
accuracy			0.75	231
macro avg	0.73	0.71	0.72	231
weighted avg	0.75	0.75	0.75	231

Logistic Regression:

	precision	recall	f1-score	support
0	0.77	0.84	0.81	150
1	0.65	0.54	0.59	81
accuracy			0.74	231
macro avg	0.71	0.69	0.70	231
weighted avg	0.73	0.74	0.73	231

GaussianNB:

	precision	recall	f1-score	support
0	0.78	0.84	0.81	150
1	0.65	0.56	0.60	81
accuracy			0.74	231
macro avg	0.71	0.70	0.70	231
weighted avg	0.73	0.74	0.73	231

2.6 Save and load the trained XGBoost model.

2.7 Test the model.

2.7.1 The model can be tested either using the command line app (script) or running it as a flask app.

2.7.2 Run the python script with '-W ignore' to suppress the warning messages:
python -W ignore Pima_Indian.py.

```
Intel(R) MPI Library 2019 Update 6 for Windows* Target Build Environment for Intel(R) 64 applications - python -W ignor...
(base) C:\Users\SengTian\Downloads\Temp\Republic Polytechnic\Assignment_MachineLearningFundamental\
TIPPAI_ML_Fundamentals_Koay_Seng_Tian>python -W ignore Pima_Indian.py
=====
Note: Please ensure "xgboost" is installed before proceeding.
Instruction:
1) pip install xgboost
2) To supress warning: python -W ignore Pima_Indian.py
=====
Menu
1) Load dataset.
2) Prepare dataset.
3) Train model.
4) Save model.
5) Load model.
6) Test Model

Enter your selection (1-6, or 0 to quit) ?
```

2.7.3 Run the Flask app via mobile phone or desktop's web browser. This is a browser-based app. To run the webapp, go to the webapp directory and issue the python command i.e. **python webapp.py**. Open a web browser and enter the URL as **<http://127.0.0.1:6800>**.

A screen captured video is also aviable (Screenrecorder-2020-02-15-11-48-05-218.mp4) and stored in the webapp directory. You can watch the video by drag the file to a chrome browser.

```

3.0 Summary

XGBoost algorithm was selected based on its higher ROC_AUC metric. XGBoost is also a fast algorithm. However, the three algorithms were quite close when metrics like True Positives (TP) and True Negatives (TN) were compared. Much can still be done, for example, to further fine tune the hyperparameters of each of the top three models. Like any medical related dataset, the dataset was also skewed. As mentioned, the dataset is skewed by a ratio of 65:35 i.e. 65% were diagnosed to have no diabetes. When time permits, I will like to up-sample the minority (have diabetes) or down-sampling the majority (no diabetes) to see whether the prediction outcome can be further improved.
